

Setting up a Google service account key

A step-by-step guide to generating the JSON key this connector needs, and authorizing it in Google Workspace.

1. Create or choose a Google Cloud project

1. Go to `console.cloud.google.com` and sign in with an account that has access to your Google Cloud organization.
2. Create a new project (or reuse an existing one dedicated to this integration) via the project picker at the top of the page.

2. Enable the required APIs

1. In the Cloud Console, go to **APIs & Services** › **Library**.
2. Search for and enable each of the following:
 - Admin SDK API
 - Chrome Management API
 - Chrome Policy API
 - Alert Center API

3. Create the service account

1. Go to **APIs & Services** › **Credentials** › **Create credentials** › **Service account**.
2. Give it a clear name, e.g. `chromeos-connector`. You can skip granting it any Cloud IAM roles - this integration authorizes entirely through Workspace domain-wide delegation instead, not Cloud IAM.
3. Click **Done**.

4. Generate the JSON key

1. Open the service account you just created from the Credentials list.
2. Go to the **Keys** tab › **Add key** › **Create new key**.
3. Choose **JSON** and click **Create** - the key file downloads immediately.

This file is a credential, not a password reminder - treat it like one. Anyone who has it can act as this service account. Store it somewhere access-controlled, and never commit it to source control.

5. Note the Client ID

1. Still on the service account's details page, find the **Unique ID** (a long numeric string) - this is the Client ID you'll paste into Workspace Admin console next. This connector's portal also reads it straight out of the JSON key file for you the moment you upload it, so you don't need to copy it by hand.

6. Authorize domain-wide delegation in Workspace Admin console

1. Go to `admin.google.com` › **Security** › **API controls** › **Domain-wide delegation**.
2. Click **Add new**, paste in the Client ID from step 5.
3. Paste in the full scope list below (comma-separated, exactly as shown) and click **Authorize**.

```
https://www.googleapis.com/auth/admin.directory.device.chromeos,  
https://www.googleapis.com/auth/admin.directory.user.readonly,  
https://www.googleapis.com/auth/admin.directory.orgunit.readonly,
```

```
https://www.googleapis.com/auth/chrome.management.reports.readonly,  
https://www.googleapis.com/auth/admin.directory.group.readonly,  
https://www.googleapis.com/auth/admin.directory.device.mobile.readonly,  
https://www.googleapis.com/auth/admin.reports.audit.readonly,  
https://www.googleapis.com/auth/admin.reports.usage.readonly,  
https://www.googleapis.com/auth/apps.alerts,  
https://www.googleapis.com/auth/chrome.management.policy.readonly,  
https://www.googleapis.com/auth/admin.directory.rolemanagement.readonly,  
https://www.googleapis.com/auth/chrome.management.telemetry.readonly
```

This portal's Connect wizard shows you this exact scope list again (with a copy-friendly link straight to the domain-wide delegation page) once you upload the key, so you don't need to keep this PDF open side by side.

7. Upload the key into this portal

1. In the Connect wizard's Step 1, choose the JSON file you downloaded in step 4.
2. The portal reads the Client ID/service account email/project straight from the file and shows them immediately.
3. Fill in your Workspace admin email (the account being impersonated) and your Customer ID, then continue to Step 2 to authorize.

Finding your Customer ID

1. In Admin console, go to **Account › Account settings** - your Customer ID is listed there, or use the literal string `my_customer` if you're authorizing as an admin of your own domain.
